BIOCHEMISTRY

C-Reactive Protien (CRP)

Test Name	Observed Values	Units	Biological Reference Intervals
* C-REACTIVE PROTIEN(CRP)	10.2	mg/L	Up to 6.0

Method: Immunoturbidimetric

INTREPRATATION:

C - Reactive Protein (CRP) is an acute phase protein that is involved in the activation of complement, acceleration of phagocytosis and detoxification of substances released from damaged tissue. As such, CRP is considered to be one of the most sensitive indicators of inflammation. In response to an inflammatory stimulus, a rise in CRP may be detected with 6 hours. CRP is sensitive, though considered to be a non-specific indicator of acute phase reactants.

Measurement of C - Reactive Protein is most frequently used for the evaluation of injury to body tissue or for the detection of an inflammatory event somewhere in the body. CRP levels in serum are typically elevated in patients with arthritis or liver diseases such as Hepatitis A, Hepatitis B or biliary cirrhosis and after severe infections such as septic shock.
